VIDEO WALKTHROUGH

Record Orbit in three minutes

Keep this PDF open on your phone. On the laptop, record the live app and GitHub in OBS. Read each SAY THIS box aloud. The purple ring in each embedded screenshot shows where to rest your mouse.

Before pressing Record

1. Open the live app and the GitHub tabs shown later.
2. Warm the Render app; its free instance may sleep.
3. In OBS, use Window Capture for your browser.
4. Check Mic/Aux, make a 10-second test, play it back.
5. Use a fictional or redacted resume; hide keys and alerts.

Your on-screen path

00:00 Live home and 1,800 listings

00:18 Upload and parsed resume profile

00:48 Match reasons and chat filters

01:18 Job details and assisted application

01:43 Tracker and refresh persistence

02:05 Dataset, scraper and agent source

02:40 Checklist and honest limitation

00:00-00:18

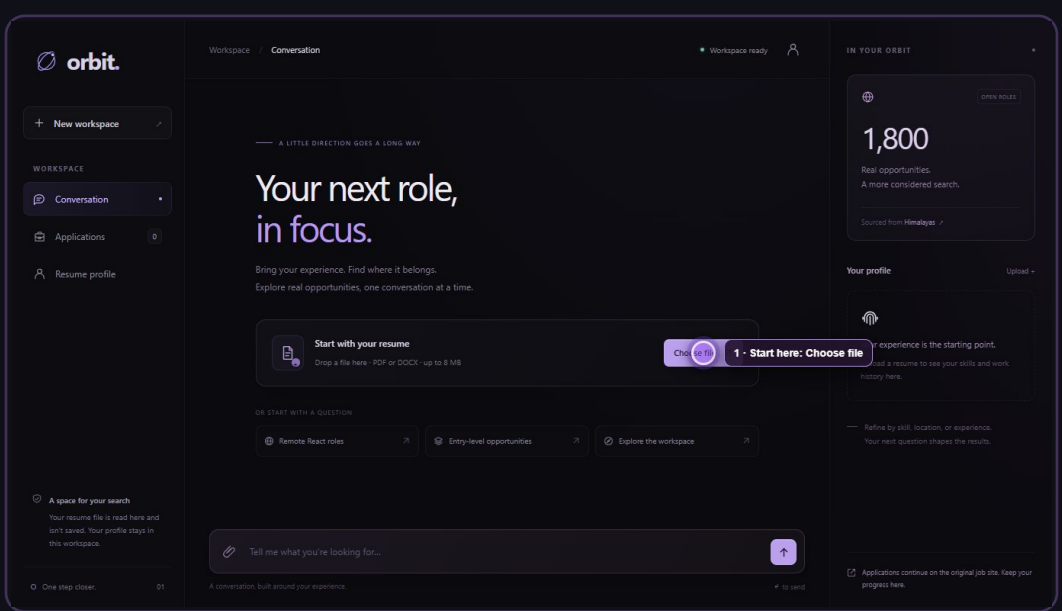

1. Introduce Orbit

SAY THIS

Hi, I'm Abhishek. This is Orbit, my job-search assistant for the Hidani Tech assessment. It reads a resume, finds suitable roles from a real job dataset, refines results through chat, and tracks application progress. I'll show the live flow.

SHOW / MOUSE

Show the live URL and 1,800-job count. Rest your pointer on Choose file.

Pointer: CHOOSE FILE on the live home page

00:18-00:48

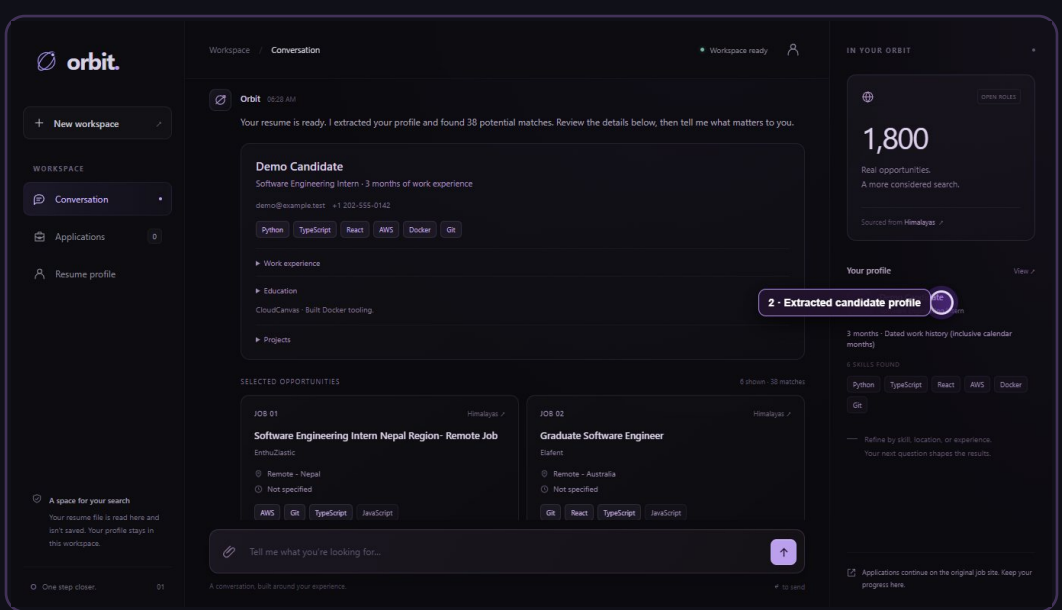

2. Upload the resume

SAY THIS

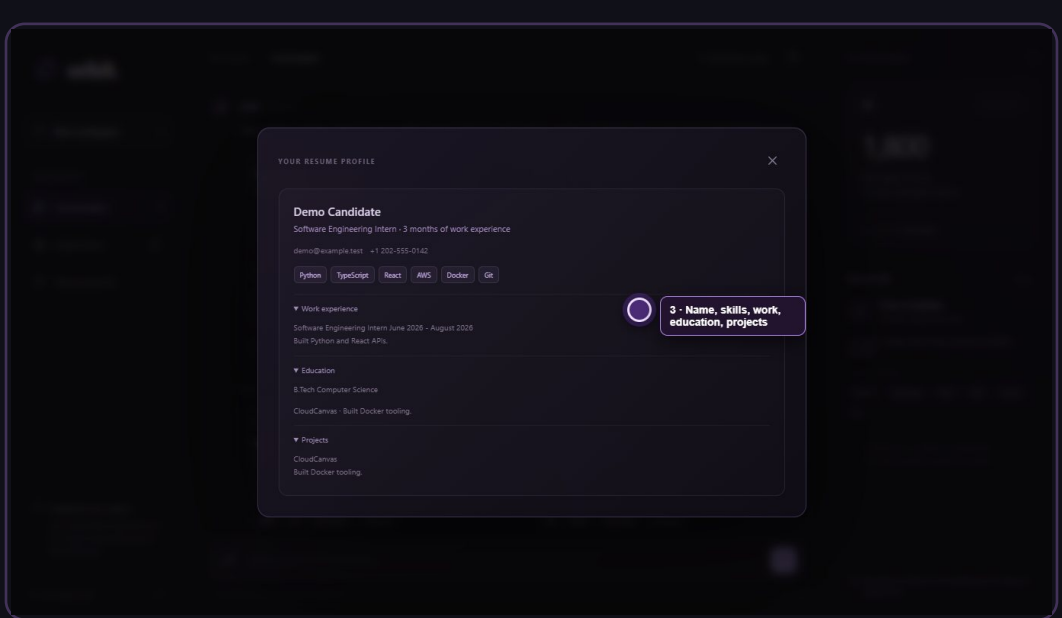

The upload accepts PDF and DOCX. Python extracts the candidate's name, contact, designation, skills, dated work experience, education and projects. Work duration comes from work entries, not college or project dates. The structured profile appears beside the conversation.

SHOW / MOUSE

Upload your prepared, redacted PDF. Point to the compact profile, then open the full profile and scroll through its sections.

Pointer: extracted profile beside the chat

Pointer: experience, education, projects and skills

00:48-01:18

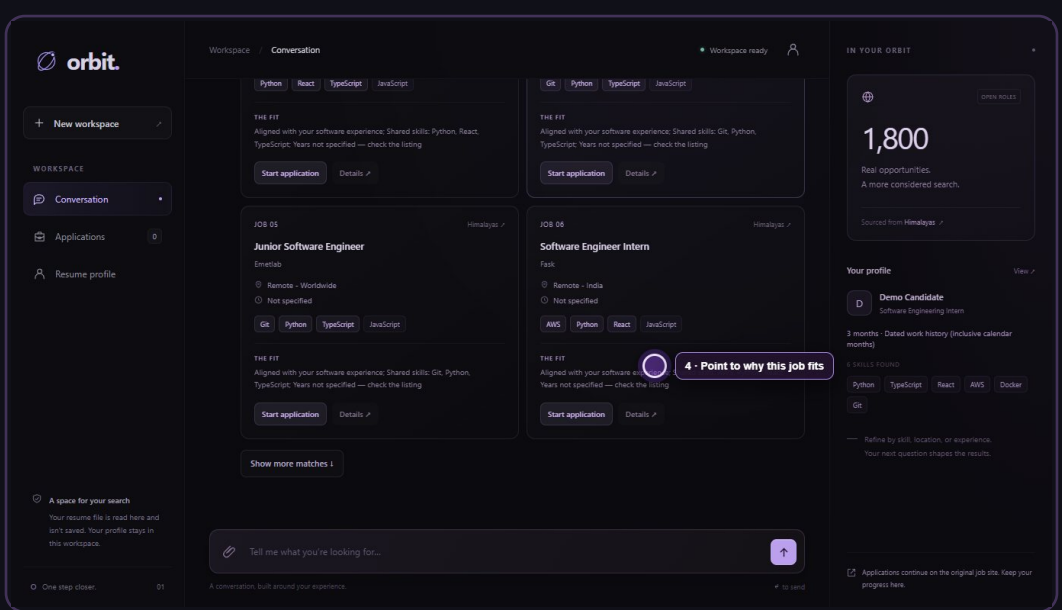

3. Match and refine

SAY THIS

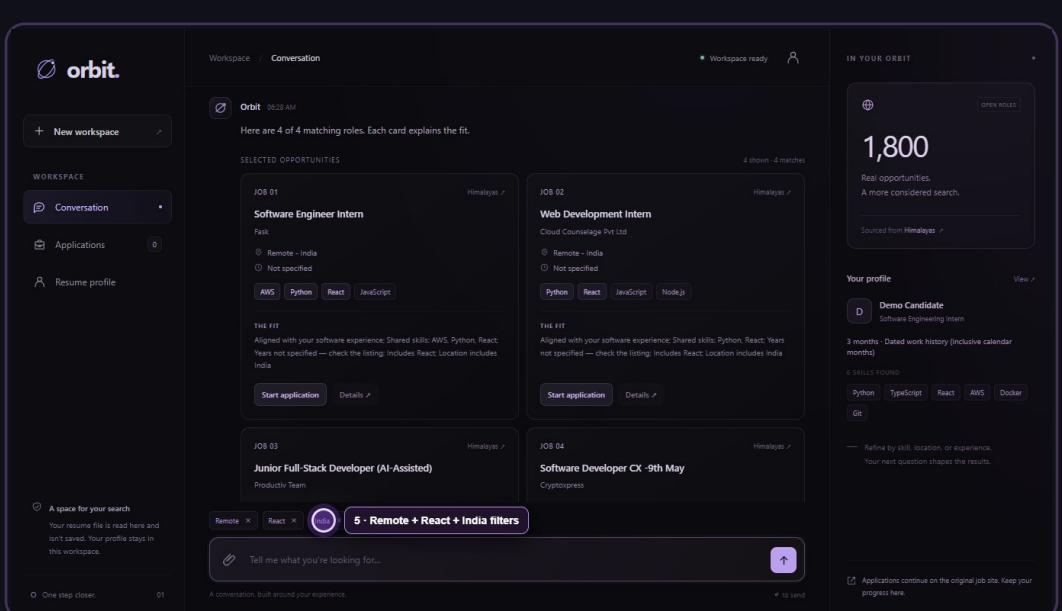

The matcher ranks relevant jobs by role, skills, experience and location. Each card explains why it fits. I can refine the same search in normal language; here I'm asking for remote React roles available in India. The filters and conversation stay in this workspace.

SHOW / MOUSE

Point at THE FIT. Type 'remote React jobs in India' in chat, then rest the pointer on active filter chips. If zero results, try 'remote React jobs'.

Pointer: THE FIT explanation on a job card

Pointer: active remote, React and India filters

01:18-01:43

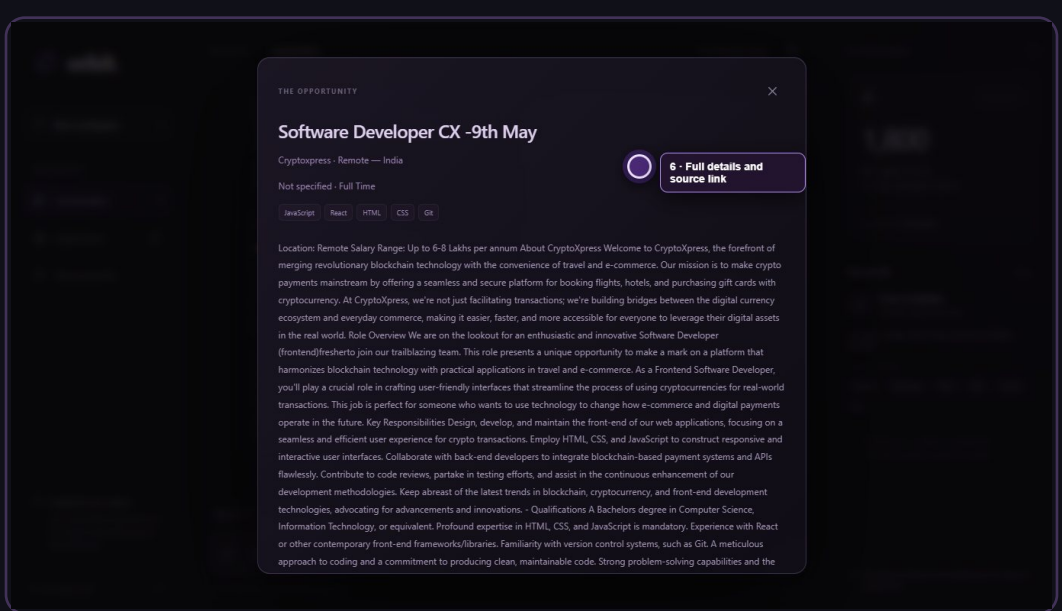

4. Inspect and apply

SAY THIS

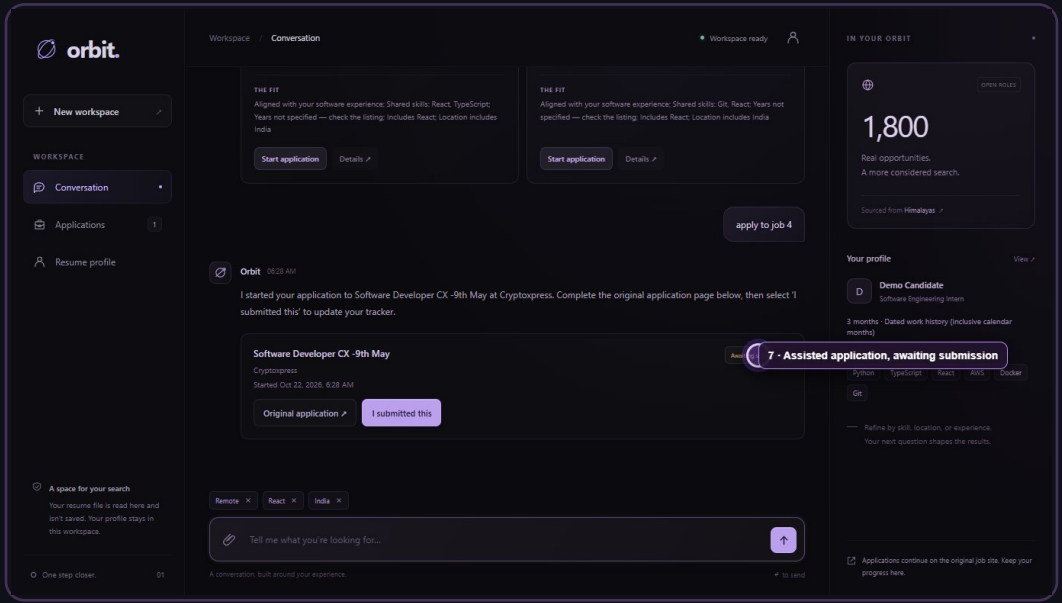

The details view keeps the original description and source link. Starting an application creates one dated tracker record and opens the employer's original form. This is assisted application tracking: the user completes the external form. Orbit does not submit it to an employer automatically.

SHOW / MOUSE

Open Details, then Start application. Point at Awaiting submission and the original application link. Do not mark it submitted unless you actually submit the employer form.

Pointer: role title and full job description

Pointer: Awaiting submission and original form

01:43-02:05

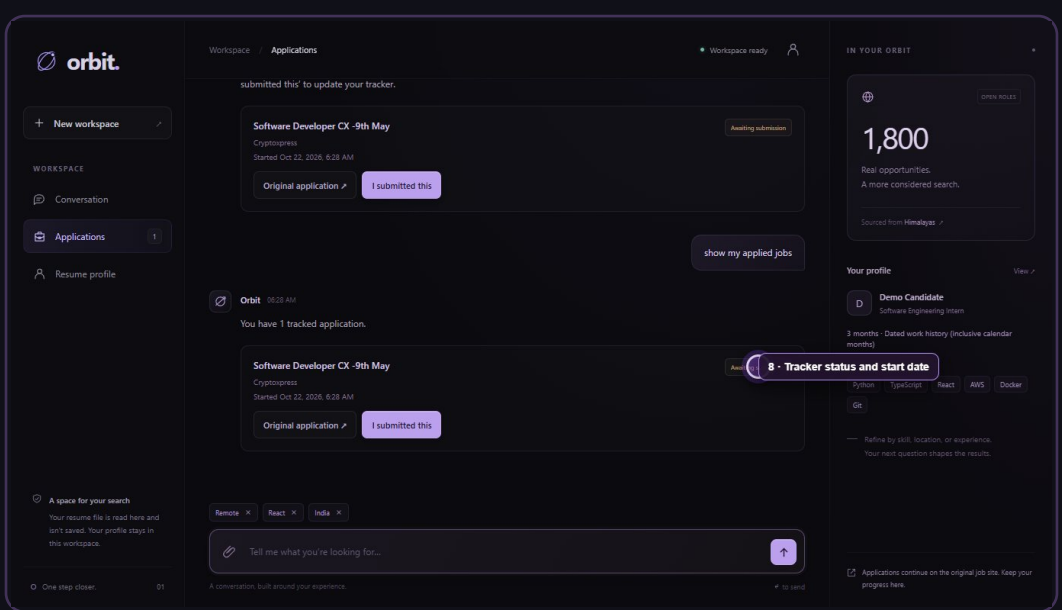

5. Show the tracker

SAY THIS

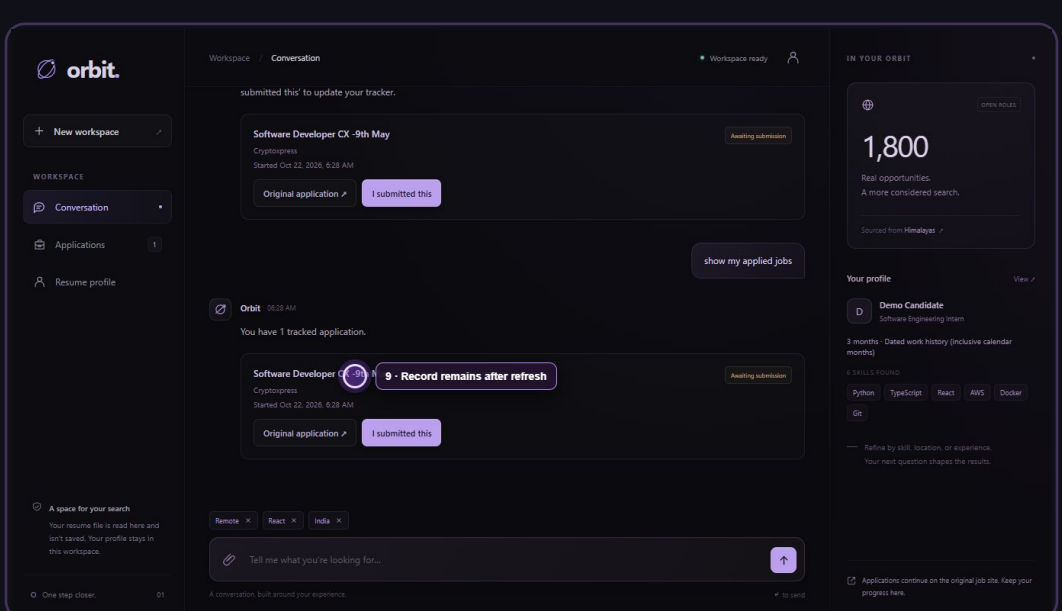

The tracker shows the job, start date and current status. Repeating the same application does not duplicate it. On Render, PostgreSQL preserves the profile, conversation and application records after refresh. The assessment requires no login.

SHOW / MOUSE

Click Applications. Point at status and date. Refresh the browser and point at the restored record.

Pointer: job, date and current status

Pointer: same record after refreshing

02:05-02:22

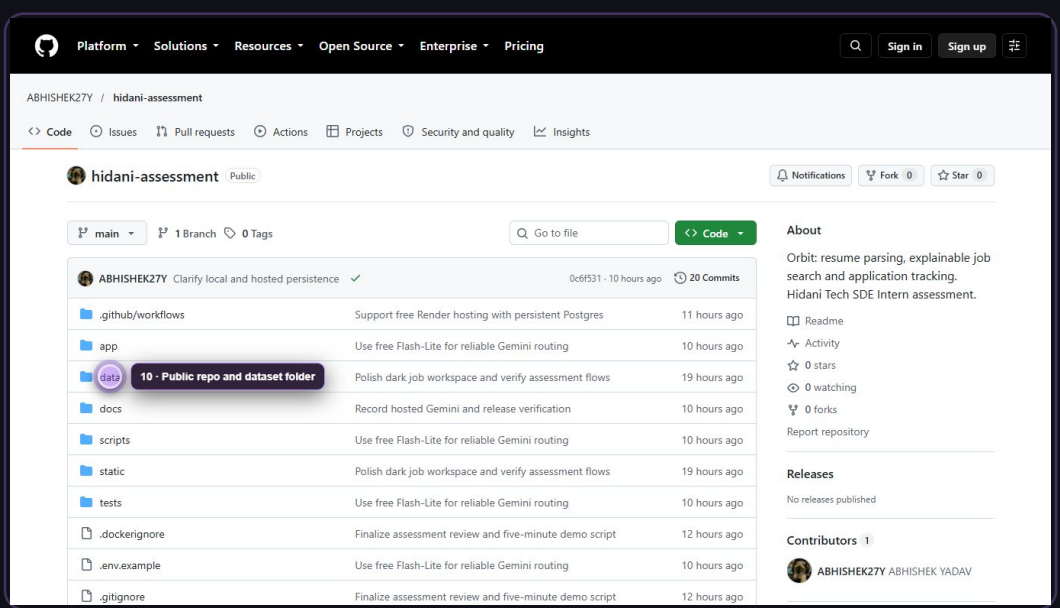

6A. Dataset

SAY THIS

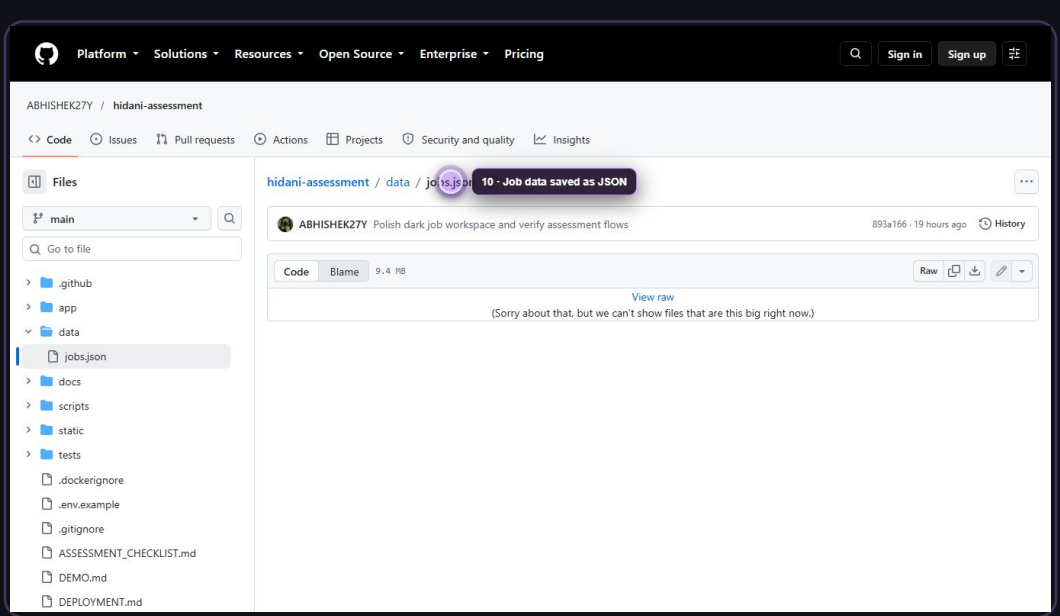

The assignment asked for 1,500 to 2,000 real listings, a JSON database and collection script. My collector fetched 1,800 unique Himalayas listings, validated required fields and removed duplicates.

SHOW / MOUSE

Switch to the pre-opened GitHub tabs. Show the repository and committed JSON file. GitHub may show View raw for the large JSON file.

Pointer: data and scripts folders

Pointer: committed jobs.json; View raw is normal

02:22-02:33

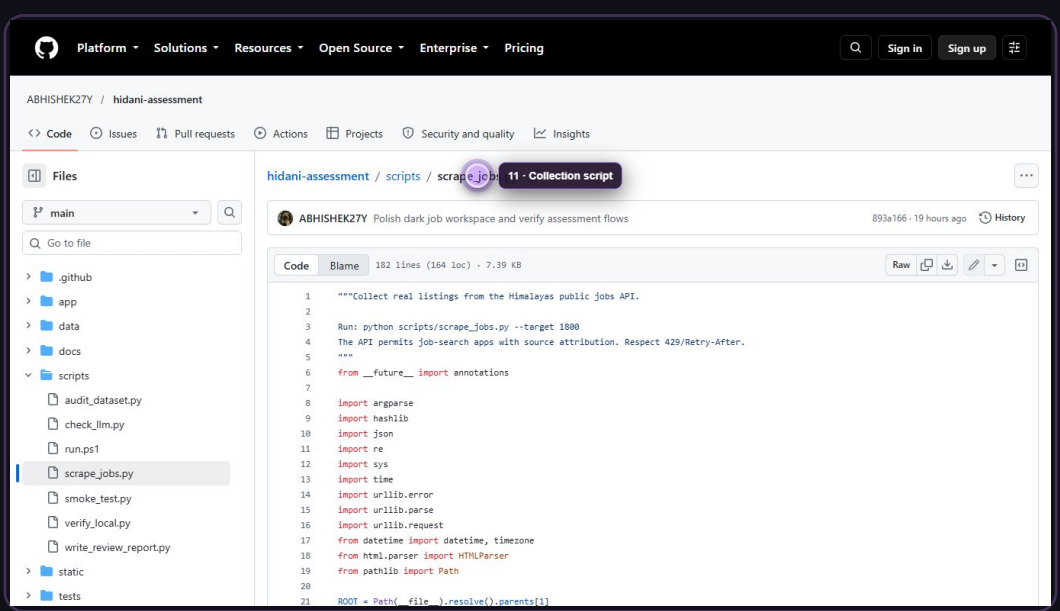

6B. Code flow

SAY THIS

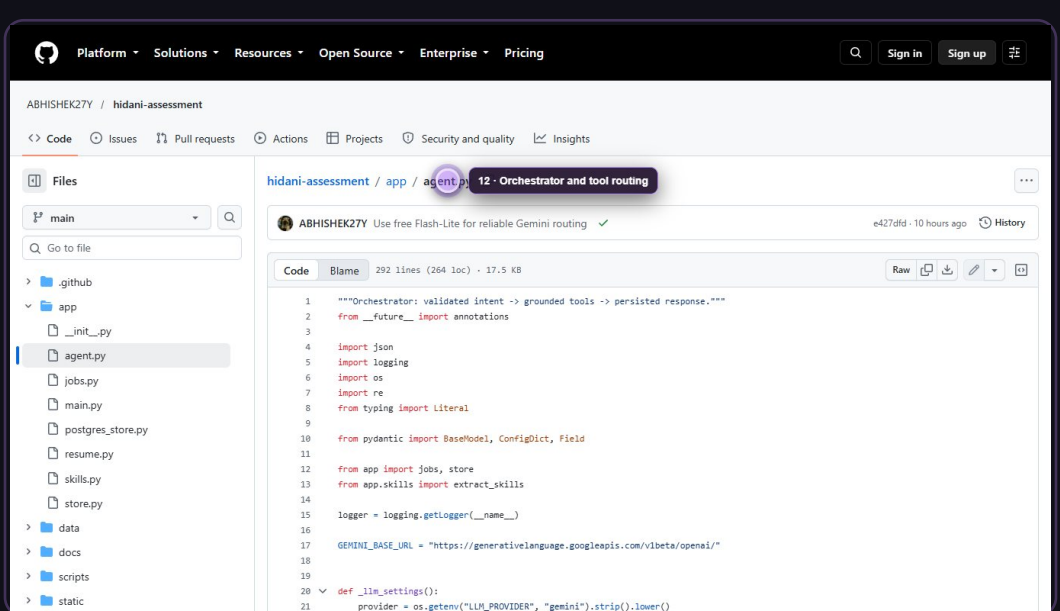

FastAPI handles uploads and chat. The agent routes requests to parsing, matching and application tools. Gemini interprets ambiguous requests, and the server validates its function arguments.

SHOW / MOUSE

Briefly point at the collector's validation, then switch to app/agent.py.

Pointer: collection and validation script

Pointer: agent routing and guarded tool calls

02:33-02:40

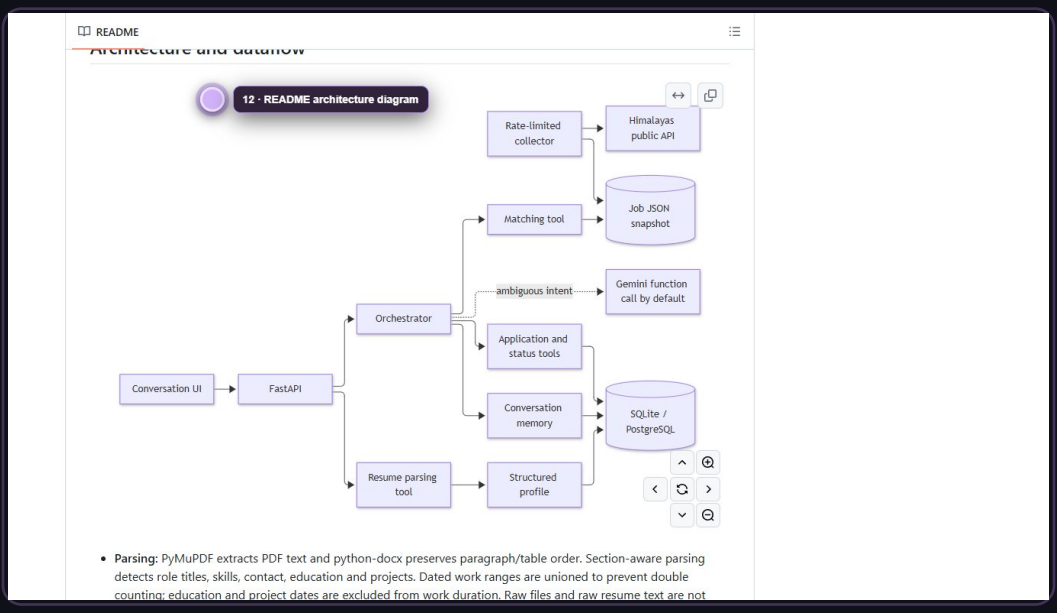

6C. Architecture

SAY THIS

Recommendations come from the saved dataset, not invented model results.

SHOW / MOUSE

Point at the README architecture diagram. Then switch to the checklist tab.

Pointer: README architecture diagram

02:40-03:00

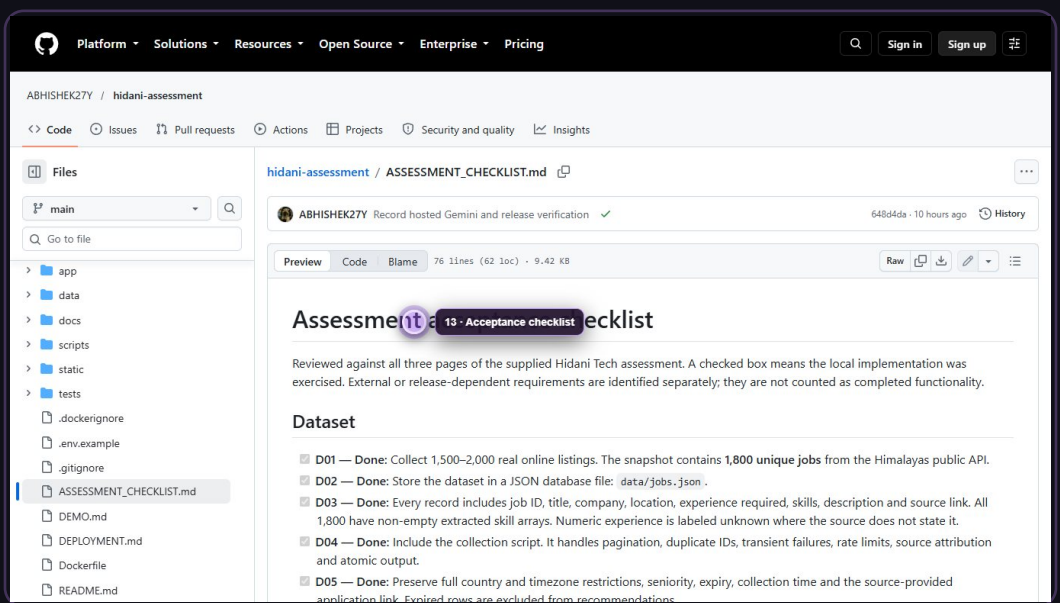

7. Verify and finish

SAY THIS

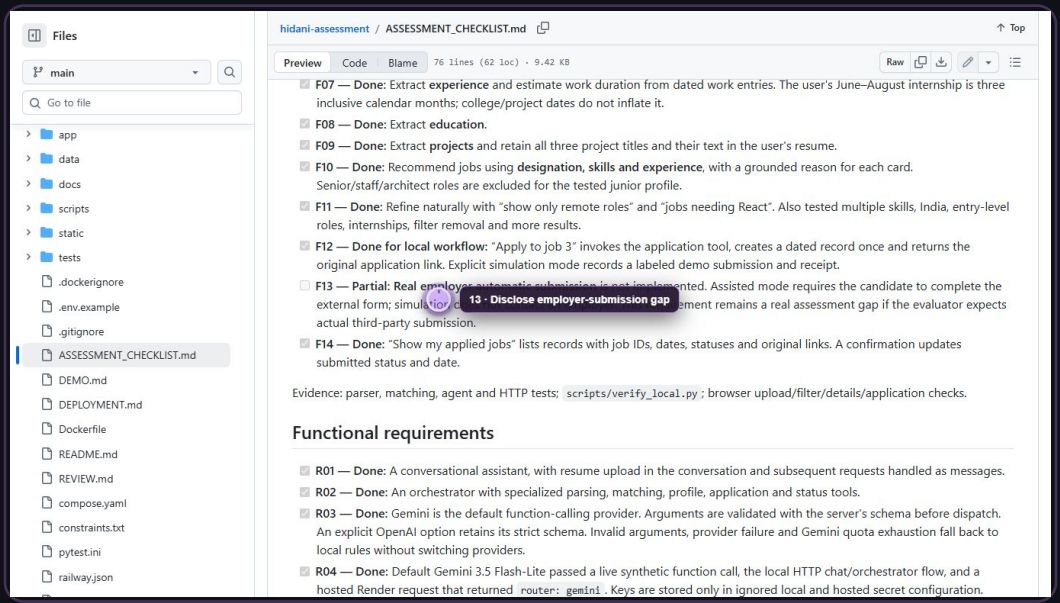

The app handles invalid job numbers, unsupported resumes and searches with no matches. Thirteen public checks and forty-five automated tests passed. The repository contains the source, dataset, scraper and setup guide. The remaining functional gap is automatic submission to third-party employer forms. Thank you for reviewing Orbit.

SHOW / MOUSE

Open ASSESSMENT_CHECKLIST.md. Point at checked requirements, then F13 - Partial. Finish on the live app. Watch your saved MP4 once before sharing.

Pointer: checked assessment requirements

Pointer: F13 - Partial, external form submission
